Pitch product design

- The problem:

Many users want to participate in online discussions but refrain from posting due to the permanence of online identities, fear of judgment, or complex on boarding processes.

Existing discussion platforms either require accounts and persistent identities or offer anonymity at the cost of structure and content quality.

There is a need for a platform that enables structured discussions while allowing users to post and comment completely anonymously, without account creation.

Many users wish however to be able to:

1. express a spontaneous opinion,
2. ask a sensitive question,
3. share a frustration,
4. discuss freely,

without being associated with a lasting identity.

- Target users:

The product is mainly intended for:

1. students and young people,
2. regular users of social networks such as Reddit or 4chan,
3. people seeking a space for simple expression and without personal exposure,
4. curious people to read honest and direct discussions.

These users prioritize speed of use, simplicity, and freedom of expression

- Concept:

1. - create a thread instantly
2. - respond to other threads
3. - interact with recent threads or proximity (you see the thread of the same location as you, you can choose our location in the location page.) threads

- UX walkthrough:

1. Firstly, the users must accept GCU (saying that their content will potentially be moderated by an ai) to continue.
2. Then, the user arrives on a home page displaying a flow of recent threads or nearby threads.
3. He can click on "Create a thread" and enter his message.
4. The publication is immediate and visible to all users.
5. Each thread can receive anonymous responses, as well as simple reactions (likes, favorites).

- MVP scope:

1. consultation of the thread feed
2. creation of threads
3. choose a location
4. see the comments of threads
5. simple reactions (like, favorites)
